# 4. Application example: Composite beam

# 5. Conclusions

- Annex L of new EC2 accounts for the additional ductility due to fibers

# 5. Conclusions

- Annex L of new EC2 accounts for the additional ductility due to fibers

- Compressive and flexural classes for SFRC are coupled

# 5. Conclusions

- Annex L of new EC2 accounts for the additional ductility due to fibers

- Compressive and flexural classes for SFRC are coupled

- The ultimate compressive strain in ULS goes up to 0.6%

# 5. Conclusions

- Annex L of new EC2 accounts for the additional ductility due to fibers

- Compressive and flexural classes for SFRC are coupled

- The ultimate compressive strain in ULS goes up to 0.6%

- These new criteria are advantageous for composite structures

# Steel-fibre reinforced concrete in composite structures as a mean to increase resistance and ductility

## Outlook in a new generation of composite structures

In honor of the jubilarian Prof. Dr.-Ing. Wolfgang Kurz

Steel-fibre reinforced concrete is a well-known material used for decades for industrial floorings, shotcrete, or other specific applications. Its use is now spreading in structural applications as a complement or a substitute for conventional bar-reinforced concrete since the normative framework is ready to provide design approaches for several concrete applications.

**Steigerung der Tragfähigkeit und Duktilität für Verbundkonstruktionen aus Stahl und Beton durch Anwendung von Stahlfaserbeton – eine neue Generation von Verbundtragwerken**

Stahlfaserbeton ist ein bekanntes Baumaterial, welches seit Jahrzehnten für Industrieböden, Spritzbeton oder andere spezifische Anwendungen zum Einsatz kommt. Seine Verwendung
